

What MicrobeTrace could look like with NG-ZORRO

Three representative UI concepts covering the largest replacement patterns: a dense table, a settings dialog, and an aggregate hierarchy/reorder workflow.

01

Data table

Strong direct fit

nz-table + filters + pagination

02

Settings dialog

Strong direct fit

nz-modal + form controls

03

Aggregate setup

Composed replacement

NG-ZORRO + Angular CDK

Bottom line

This would look like a component refresh, not a wholesale redesign. The MicrobeTrace structure and blue brand can stay familiar while controls adopt Ant Design spacing, states, and accessibility behavior.

Dense data table

A close behavioral replacement for the current PrimeNG table, while retaining MicrobeTrace's dataset and column-selection workflow.

2 rows selected

1-50 of 1,248< 1 2 3 ... 25 >

- Why it fits

Selection, sorting, filtering, fixed headers, pagination, and virtual scroll are documented table patterns.
- Likely pieces

nz-table, nz-select, nz-pagination, nz-dropdown, nz-input, and nz-button.
- Watch items

Column resize/reorder and exact filter semantics need a focused spike and regression tests.

Settings dialog

A modal-and-form pattern that keeps the existing settings workflow but uses NG-ZORRO spacing, grouping, and control states.

Why it fits

Modals, collapsible sections, selects, switches, sliders, tabs, and color controls are standard NG-ZORRO components.

Likely pieces

nz-modal, nz-collapse, nz-select, nz-tree-select, nz-switch, nz-tabs, and reactive forms.

Watch items

Overlay placement, keyboard focus, saved state, and test selectors must be verified across every dialog.

Hierarchy and reorder workflow

A realistic replacement for tree selection and PrimeNG OrderList using NG-ZORRO controls plus Angular CDK drag-and-drop.

●

What NG-ZORRO covers

TreeSelect, Select, List, buttons, modal structure, search, and standard form states.

●

What CDK adds

Angular CDK drag-and-drop supplies the reorder behavior; app code owns the row composition.

●

Migration implication

This is a higher-effort pattern than tables or dialogs, so it belongs in the first migration spike.
